

State of the Art Coal Storage System by implementation and integration of the latest available technologies

Eurosilos Fuel Management System (FMS)

Visualisation FMS

The FMS supports power plant operators with a supply planning and coal silo visualisation. The IT solution for coal silos which store several grades of coal. It is fully integrated with the silo Operator Control and Monitoring System technology.

The FMS functionality includes:

- Supply planning and scheduling
- Quality data capture
- Silo visualisation (qualitative/quantitative)
- Silo automation equipment programming
- Balances / forecasts / reports

To prepare the right blends at the right time, the FMS can be of great help. By visualising the different grades of coal in multiple silos, it enables the operators to plan the coal blending in the optimal way. By reclaiming the respective coal grades from each silo in a controlled and adjustable rate, the optimal coal blend can be prepared.

Eurosilos Air Monitoring System

Gas Detection Sensors

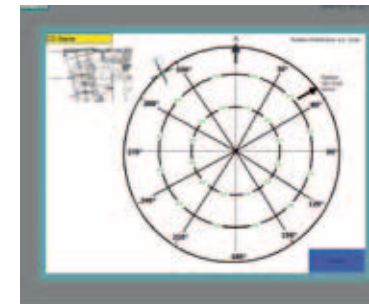

The air monitoring system ensures the necessary measuring of carbon monoxide, methane and oxygen for stored coal as stipulated in codes and rules, e.g. International Maritime Solid Bulk Cargoes Code [IMSBC Code] as well as other Fire Protection Agencies.

Fire Advanced Warning: CO vs. Temperature

Measuring carbon monoxide is strongly preferred as detection method for oxidation (self-heating) in coal storage systems due to its advanced warning period over temperature.

Eurosilos CO-Monitoring System

Visualisation CO-Monitoring

The carbon monoxide monitoring ensures an accurate system to pinpoint the changes in the measured carbon monoxide concentrations on the coal surface. Due to the slewing movement of the Eurosilos Mechanism the coal surface is scanned regularly and a hot spot is detected in an early stage.

Preventing Air Inflow

Slide Valve

By installing a slide valve, practically closing the reclaim opening of the silo, the air penetration is minimised.

Eurosilos N₂-Purging System

The N₂-purging system embodies one of the safety systems, making it possible to purge the whole or just a section of the silo, thus enabling longer trouble-free storage periods for coal.

Eurosilos Foam/Gel System

By using the skid mounted Foam/Gel system (filled with e.g. FireSorb®) it is now possible to only locally bring in foam or gel, focusing on the hot-spot location in the coal, enabling a dedicated and safe coal handling and storage.

Wear resistant flights Augers

Site Assembly, Erection & Supervision

Fully Cladded Hoppers with TIVAR® BlueLine

Tubular Structure to minimize dust settlement

Automatic Grease System

Gel-(Foam) Mixing Station

Silo Safety Access Indicator

Fully Automated Air Monitoring System

Advanced Control by Touchscreen
